Salt is a mineral composed primarily of sodium chloride (NaCl), a chemical compound belonging to the larger class of salts; salt in its natural form as a crystalline mineral is known as rock salt or halite. Salt is present in vast quantities in seawater, where it is the main mineral constituent. The open ocean has about 35 grams (1.2 oz) of solids per liter of sea water, a salinity of 3.5%.

Video Transcript: Hello and welcome to the Qorpak packaging laboratory. Today, we are discussing plastic paneling and the benefits of fluorination. You might be wondering why you would want to fluorinate a bottle. Certain products react with the plastics in a bottle, which causes paneling, such as a sucking in that you might see on your store shelves.

Deterioration of concrete pavements in the United States has increased over the past decade. This damage is triggered by two possibilities: classic freeze-thaw behavior, as well as the formation of calcium oxychloride (CAOXY) that originates from calcium chloride (CaCl₂) in deicing salt. CAOXY is an expansive phase leading to damage and cracking in the cementitious matrix.
